Allowable Subject Matter

3. Claims 1-33 allowed.
4. The following is an examiner's statement of reasons for allowance:

The current invention allows for the insertion of instrumentation logic which executes to function as a simulation breakpoint to be applied to gate-level circuit simulation. This is done by inserting instrumentation points into the Register Transfer Level (RTL) design, which can then be synthesized to the gate-level description. The closest prior art, the Matisse system (as taught by the prior cited Chen and Kucukcakar) teaches a similar process applied to a higher level of the design process, specifically allowing source level debugging on the RTL design that has been synthesized from the HDL design description. The current invention extends this capability to a lower level in the design process, namely in the gate-level description that has been synthesized from the RTL description. This advantageously allows for the use of simulation breakpoints implemented by inserting "instrumentation logic into the RTL description (as indicated in the specification pg. 42, line 24) in a gate-level circuit simulation. This provides a distinct advance over the prior art methods of matching input vectors to output vectors and attempting to back out the fault based only on these vectors.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably
